

How Cyan would be deployed: the work travels to your footage, the record travels everywhere.

SCAN · KEEP THIS PAGE

This is how Cyan would potentially be deployed for a floor like yours. It runs beside your storage: raw media never leaves your site, the seats share one record, and only small things travel between racks. It starts as half a rack and grows by adding racks.

Your footage stays put

Engines run at the site that holds the media root. Conform, grade and render happen against your storage, on your floor.

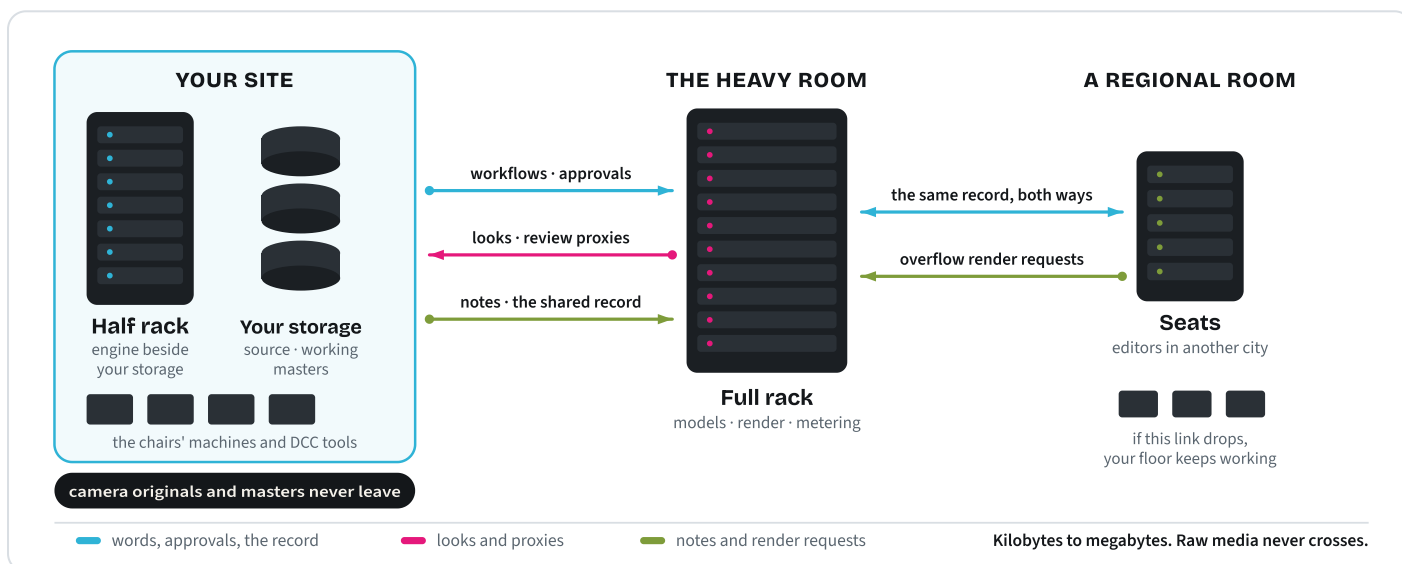

The record is yours, and cloudless

Boards, notes, approvals and the cut's history sync between your seats. A seat needs a link to the other seats, not to a cloud.

Only small things cross

Proxies, looks, comments, approvals and workflow definitions move between rooms. Masters are delivered from the site that made them.

Three racks, and what travels between them

A phased build-out, as proposed

PHASE	WHERE	WHAT WOULD RUN	SCALE, AS AN ESTIMATE
One	Your site, half a rack	The engine and its database on one machine, one reading model, working storage	One or two engines, single-digit seats, about five kilowatts
Two	The heavy room, a full rack	GPU render workers, larger judging models, the activity log and usage metering, the hot cache	About sixteen GPUs within a ten-kilowatt rack, repeatable per rack
Three	A regional site	Regional seats with their own permissions, overflow render, an optional shared model gateway	Seats and burst render; the main floor is never dependent on it

A second studio with its own storage is the same playbook: a room beside their media, on their own record. New hardware is needed only when sustained GPU use passes seventy percent.

What we need from you to start

- Where the media root lives, and how it is shared.
- A rack slot with power for the first room.
- The seats' machines and their DCC licenses: Premiere, Resolve, Pro Tools.
- Who sits in which chair on day one.

What you get in the first week

- A show set up from one sentence, on your floor.
- One shoot day run end to end: arrival, dailies, rough cut, lock, hand-offs.
- Every step receipted on your own record.
- A walk-through with each chair at their own screen.
